

# Mexia Acceleration Framework

**The Mexia Acceleration Framework ('MAF')** helps to jumpstart an organisation's integration capabilities through the delivery of pre-built software components, process guidance, and document templates that will support our proven enterprise integration methodology. It is an essential cornerstone of an **Enterprise Integration Platform ('EIP')**.

The MAF takes away the pain of designing software integration solutions by providing a common platform and implementation approach, which supports much more efficient & effective development and significantly reduces implementation risks & costs.

## Process Guidance

Mexia offers considerable expertise and guidance in industry best practices for integration throughout all phases of the project.

## Software

The MAF includes a collection of pre-built software components that implement all the non-functional integration 'plumbing' in the EIP. This allows developers to concentrate on building services concerned with the business logic.

## Document Templates

Mexia provides a collection of document templates to aid in conducting analysis and design for future integration projects.

## The Benefits

**Reducing Risk** - The Development Methodology ensures a consistent approach to design and development through the use of guidelines, document templates, and change, version and migration procedures.

**Faster Development** - The Technical Component Library reduces development time by allowing developers to use pre-built components that are commonly used, rather than "reinventing the wheel" each time. They are able to select auditing, logging, and validation "functions" that have been previously built and tested.

**Centrally Managed Operational Environment** - Every solution developed uses the same Operational Architecture. This provides your Operational Support Team a central area for managing and reporting your enterprise integration solutions. This, combined with the Interface Support Summary, means your team knows what each interface is, what can go wrong and how to react if it does.
