

## Leaders in software integration

Mexia are enablers of business process automation, system integration and data analysis solutions for clients that need efficient, automated and measurable business processes. We bring the experience, the talent, the methodology and the tools to help you **connect, automate, analyse** and **understand** your integrated business processes.

Mexia is a leading provider of software integration solutions. Mexia implements reliable Microsoft-based integration solutions that enable business and government to deliver high-performance services to their customers.

Integration has become a vital capability that allows organisations to achieve and maintain business performance. Competitive advantage can only be maintained by supporting the business's ability to remain agile and to respond to customer and market changes. An organisation's ability to utilise information in their systems, automate their processes and present themselves to their trading partners and customers is key to survival.

We only hire architects, software developers, testers and administrators who intuitively understand system integration & process automation, which in turn ensures you receive the highest quality solutions & advice from people who have actually done it all before.

### Our Philosophy

Our philosophy is to Connect - Automate - Analyse - Understand, all within the context of:

- Build purpose-driven architecture layers
- Design for maintenance
- Standards based (XML, XSD, SOAP etc)
- Standardised messaging patterns
- Pluggable & extensible components
- Centralised operational reporting
- Centralised architecture governance

By using our Acceleration Framework to build Enterprise Integration Platforms, we significantly reduce the complexity of establishing an integration architecture in the enterprise and ensure that the focus is on solving the business problems at hand ("business value") rather than having to focus on non-functional ("plumbing") features like infrastructure deployment, operational reporting & management and long term maintainability.
